

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Previously Presented) An ultrasound probe, comprising:
a support member comprising an acoustic dampening material;
a signal cable comprising a plurality of electrically conductive members extending continuously along the length of said signal cable, wherein a distal end portion of each of said plurality of electrically conductive members is separately embedded within and continuously extends into and through said support member to a first side thereof from a second side thereof, wherein a flexible primary portion of said signal cable extends proximally away from said second side of the support member and includes an electrically non-conductive material, and wherein said plurality of electrically conductive members are electrically separated in said flexible primary portion of the signal cable by said electrically non-conductive material; and,
an ultrasound transducer array supportably mounted to said first side of said support member, said ultrasound transducer array including a plurality of transducer elements that are electrically, directly and fixedly interconnected to a distal end of corresponding different ones of said plurality of electrically conductive members at said first side of the support member, wherein each of said electrically conductive members of the signal cable extends continuously from a proximal end corresponding with the proximal end of said flexible primary portion of the signal cable, continuously into said second side of the support member, and continuously through said support member to said corresponding distal end at the first side of the support member.
2. (Previously Presented) An ultrasound probe as recited in Claim 1, wherein the second side of the support member opposes the first side thereof.
3. (Original) An ultrasound probe as recited in Claim 2, wherein said electrically conductive members follow substantially parallel paths through said support member.
4. (Original) An ultrasound probe as recited in Claim 2, wherein said support member includes a plurality of openings, extending therethrough from said second side to said first side thereof, for separately receiving different ones of said plurality of electrically conductive members in one-to-one relation.

5. (Previously Presented) An ultrasound probe as recited in Claim 4, wherein said support member comprises:

first and second members interconnected on adjoining sides thereof with said plurality of electrically conductive members captured and extending therebetween from said second side to said first side of the support member.

6. (Original) An ultrasound probe as recited in Claim 5, wherein said plurality of openings are defined by channels on at least one said adjoining sides of said first and second members.

7. (Cancelled).

8. (Previously Presented) An ultrasound probe as recited in Claim 1, wherein said acoustic dampening material has an acoustic dampening index of at least about 1 dB/cm MHz.

9. (Previously Presented) An ultrasound probe as recited in Claim 1, wherein said acoustic dampening material substantially surrounds the distal end portions of said plurality of electrically conductive members.

10. (Previously Presented) An ultrasound probe as recited in Claim 1, wherein said support member comprises:

adjoined first and second portions comprising different first and second acoustic dampening materials, respectively.

11. (Original) An ultrasound probe as recited in Claim 1, wherein said first side of said support member includes a plurality of separated portions, and wherein different ones of said plurality of electrically conductive members extend through different ones of said plurality of separated portions.

12. (Original) An ultrasound probe as recited in Claim 11, wherein said plurality of transducer elements are supportably interconnected to different ones of said plurality of separated portions of said support member.

13. (Original) An ultrasound probe as recited in Claim 12, wherein said plurality of transducer elements are defined by separated portions of a piezoelectric material.

14. (Currently Amended) An ultrasound probe as recited in Claim 13, wherein said plurality of transducer elements are further defined by separated portions of at least one electrically conductive signal layer interconnected between a first side of said piezoelectric layer material and corresponding ones of said plurality of separated portions of said support member.

15. (Currently Amended) An ultrasound probe as recited in Claim 13, wherein said plurality of transducer elements are further defined by an electrically conductive ground member interconnected to a

second side of said piezoelectric layermaterial in opposing relation to said first side of said support member.

16. (Currently Amended) An ultrasound probe as recited in Claim 15, wherein said first electrically conductive ground member is electrically connected to a conductive ground member of said signal cable.

17. (Currently Amended) An ultrasound probe as recited in Claim 15, further comprising:
an acoustic impedance matching layer interconnected to said electrically conductive ground member.

18. (Original) An ultrasound probe as recited in Claim 1, wherein a primary portion of each of said plurality of electrically conductive members extends proximally from said support member, and wherein said primary portions of said plurality of electrically conductive members comprise at least a majority of the lengths of said plurality of electrically conductive members from a distal end to a proximal end of said signal cable.

19. (Original) An ultrasound probe as recited in Claim 18, further comprising:
a coupler, fixedly disposed at said proximal end of said signal cable, for selective interconnection and disconnection of said ultrasound probe to an ultrasound imaging system.

20. (Original) An ultrasound probe as recited in Claim 18, wherein said signal cable further comprises:

an electrically non-conductive and flexible carrier, wherein said plurality of electrically conductive members are separately interconnected in coincidental orientations to said carrier.

21. (Previously Presented) An ultrasound probe as recited in Claim 20, wherein said signal cable further comprises:

an electrically conductive member interconnected to said flexible carrier.

22. (Currently Amended) An ultrasound probe, comprising:
a support member comprising an acoustic dampening material having an acoustic dampening index of at least about 1db/cm MHz;

a signal cable comprising a plurality of electrically conductive wires extending continuously along the length of said signal cable, wherein a distal end portion of each of said plurality of electrically conductive wires is separately embedded within and continuously extends into and through said support member from a first side thereof ~~from~~to a second side thereof, wherein a flexible primary portion of said signal cable extends proximally away from said second side of the support member and includes an electrically non-conductive material, wherein said plurality of electrically conductive wires are electrically separated in said flexible primary portion of the signal cable by said electrically non-conductive material,

and wherein the proximal end of each of said electrically conductive wires is fixedly interconnected to a coupler; and

an ultrasound transducer array is supportably mounted to the first side of the support member, said ultrasound transducer array including a plurality of transducer elements that are electrically, directly and fixedly interconnected to a distal end of corresponding different ones of said plurality of electrically conductive wires at said first side of the support member, wherein each of said electrically conductive wires of the signal cable extends continuously from a proximal end corresponding with the proximal end of said flexible primary portion of the signal cable, continuously into said second side of the support member, and continuously through said support member to said corresponding distal end at the first side of the support member.

23. (Original) An ultrasound probe as recited in Claim 22, wherein said plurality of electrically conductive wires follow substantially parallel paths through said support member.

24. (Original) An ultrasound probe as recited in Claim 23, wherein said support member includes a plurality of openings, extending from said second side to said first side thereof, for conformally and separately receiving different ones of said plurality of electrically conductive wires in one-to-one relation.

25. (Previously Presented) An ultrasound probe as recited in Claim 22, wherein said support member comprises:

first and second members interconnected on adjoining sides thereof with said plurality of electrically conductive wires captured and extending therebetween from said second side to said first side of the support member.

26. (Original) An ultrasound probe as recited in Claim 22, where said support member substantially surrounds the distal end portions of said plurality of electrically conductive wires.

27. (Original) An ultrasound probe as recited in Claim 22, further comprising:

a plurality of signal cables each comprising a plurality of electrically conductive wires extending along the length thereof, wherein a distal end portion of each of said plurality of electrically conductive wires comprising each of said plurality of signal cables is separately and at least partially embedded within and extends through said support member from said second side to said first side thereof, and wherein said ultrasound transducer array includes a further plurality of transducer elements electrically and fixedly interconnected to different ones of said plurality of electrically conductive wires of said plurality of signal cables at said first side of the support member.

28. (Previously Presented) An ultrasound probe as recited in Claim 27, wherein said support member comprises:

first and second members interconnected on adjoining sides thereof with said plurality of electrically conductive wires of each of said plurality of signal cables captured and extending therebetween from said second side to said first side of the support member.

29. (Previously Presented) An ultrasound probe as recited in Claim 27, wherein said support member comprises:

a plurality of support members interconnected in a stacked manner, wherein said plurality of electrically conductive wires of different ones of said plurality of signal cables are captured and extending between different adjacent pairs of said plurality of support members from said second side to said first side thereof.

30. (Previously Presented) An ultrasound probe, comprising:

a support member, wherein said support member comprises adjoined first and second portions comprising different first and second acoustic dampening materials, respectively;

a signal cable comprising a plurality of electrically conductive members extending continuously along the length of said signal cable, wherein a distal end portion of each of said plurality of electrically conductive members is separately embedded within and continuously extends into and through said support member to a first side thereof from a second side thereof, wherein a flexible primary portion of said signal cable extends proximally away from said second side of the support member and includes an electrically non-conductive material, and wherein said plurality of electrically conductive members are electrically separated in said flexible primary portion of the signal cable by said electrically non-conductive material; and,

an ultrasound transducer array supportably mounted to said first side of said support member, said ultrasound transducer array including a plurality of transducer elements that are electrically, directly and fixedly interconnected to a distal end of corresponding different ones of said plurality of electrically conductive members at said first side of the support member, wherein each of said electrically conductive members of the signal cable extends continuously from a proximal end corresponding with the proximal end of said flexible primary portion of the signal cable, continuously into said second side of the support member, and continuously through said support member to said corresponding distal end at the first side of the support member.

31. (Currently Amended) An ultrasound probe, comprising:

a support member comprising an acoustic dampening material, wherein a first side of said support member includes a plurality of separated portions;

a signal cable comprising a plurality of electrically conductive members extending continuously along the length of said signal cable, wherein a distal end portion of each of said plurality of electrically conductive members is separately embedded within and continuously extends into and through said support member to said first side thereof from a second side thereof, wherein different ones of said plurality of electrically conductive members extend through different ones of said plurality of separated portions, wherein a flexible primary portion of said signal cable extends proximally away from said second side of the support member and includes an electrically non-conductive material, and wherein said plurality of electrically conductive members are electrically separated in said flexible primary portion of the signal cable by said electrically non-conductive material; and,

an ultrasound transducer array supportably mounted to said first side of said support member, said ultrasound transducer array including a plurality of transducer elements that are electrically, directly and fixedly interconnected to a distal end of corresponding different ones of said plurality of electrically conductive members at said first side of the support member, wherein each of said electrically conductive members of the signal cable extends continuously from a proximal end corresponding with the proximal end of said flexible primary portion of the signal cable, continuously into said second side of the support member, and continuously through said support member to said corresponding distal end at the first side of the support member; and,

~~an ultrasound probe as recited in Claim 1, wherein said first side of said support member includes a plurality of separated portions, and wherein different ones of said plurality of electrically conductive members extend through different ones of said plurality of separated portions.~~

32. (Previously Presented) An ultrasound probe as recited in Claim 31, wherein said plurality of transducer elements are supportably interconnected to different ones of said plurality of separated portions of said support member.

33. (Previously Presented) An ultrasound probe as recited in Claim 32, wherein said plurality of transducer elements are defined by separated portions of a piezoelectric material.

34. (Currently Amended) An ultrasound probe as recited in Claim 33, wherein said plurality of transducer elements are further defined by separated portions of at least one electrically conductive signal layer interconnected between a first side of said piezoelectric layer material and corresponding ones of said plurality of separated portions of said support member.

35. (Currently Amended) An ultrasound probe as recited in Claim 33, wherein said plurality of transducer elements are further defined by an electrically conductive ground member interconnected to a second side of said piezoelectric ~~layer~~material in opposing relation to said first side of said support member.

36. (Currently Amended) An ultrasound probe as recited in Claim 35, wherein said first electrically conductive ground member is electrically connected to a conductive ground member of said signal cable.

37. (Previously Presented) An ultrasound probe as recited in Claim 35, further comprising:
an acoustic impedance matching layer interconnected to said ground member.
